

PlateTronic Ultima Installed Above Ground June 2007

The automotive section was fortunate enough approaching the end of the 2006 – 2007 financial year to have funds available for purchasing automotive equipment. One of the items on the desired shopping list was the PlateTronic Brake Steering and Suspension test System.

Several of the apprentices currently attending the TAFE already use this system as a part of the servicing routine with their current employers. They are always singing its praises regarding the work it finds for them along with the safety aspect of not going on to a public road for brake testing. It is constantly finding brake problems and just as important are the number of wheel alignment jobs it finds. Customers at these different workshops all appreciate the fact that their 'mechanic' is taking a genuine interest in the safety, maintenance and general condition of their cars.

Some of the TAFE teachers have also used this system in workshops and they too are impressed with the accuracy of the PlateTronic test unit.

We commend the technician that carried out the installation. He discussed the process with us to ensure that the equipment was installed in the correct location where it would best suit the automotive department. The installation and work area were left in a very clean condition. Here at Glendale TAFE we are impressed with this new technology in the automotive department and the enthusiasm of the apprentices using it as part of their training.
